Symmetric bi-directional amplifier.

A transceiver module (10) includes a bi-directional amplifier (16) having a pair of symmetric signal paths for amplification of both transmit and receive signals. The bi-directional amplifier (16) is disposed between a pair of r.f. switches (14, 18) to provide a pair of signal paths between two terminals of the module (10). The amplifier (16) has an input propagation network (30) coupling two input terminals (16a, 16b), and an output propagation network (32) coupling two output terminals (16c, 16d). A plurality of FETs (FET1, FET2, FET3, FET4) have their gates connected to the input propagation network (30) and their drains connected to the output propagation network (32). Electrical path lengths are selected so that an input signal at one input terminal (16a) propagates with amplification to one output terminals (16c) and an input signal at the other input terminal (16b) propagates with amplification to the other output terminal (16d).
